

The use of Hyaluronic Acid filler in the treatment of nasolabial folds (25 cases)

Giarmi Eleftheria, MD, PhD
General Surgeon

We present the use of hyaluronic acid fillers in the treatment of nasolabial folds in 25 patients, aged 35-65 years old. Cross-linked Hyaluronic acid filler was used and the quantity varied according to each patient's needs from 0,5ml to 2ml. The volume of material used depended on the depth of the folds and the quality of each patient's skin. The injection techniques used were the linear technique, the depot technique and the fanning technique.

Linear technique

Depot technique

Fanning technique

SUCCESS FACTORS

- ✓ Choice of injection technique
- ✓ Quantity of HA injected
- ✓ Exact point of injection
(according to the structural anatomy of the patient's face, the firmness and the tissue relaxation of their skin).

The results shown a high improvement in the lower area of the patients faces, offering them a rejuvenated, younger looking appearance without deforming their natural characteristics.
